Now, you have to think about it in this way, that if I am a person, the owner of the organisation, I should know that this project, whatever delivery was made, was it amber or green? Green means that everything was okay. Amber means that one thing went wrong in that and two or three things went wrong. And the warning in red means that everything was in it.

Ok? So that's the thing. Ok. Now there are multiple modules in this.

One is this update module. This is not a very extensive module. But we have to make it in such a way that there will be projects in it.

There will be resources. Ok? All the resources that will come in it, like me, all the people under me, that's the game. So now when I am defining a project, I will tell them who is its delivery manager, who is its project manager, who are its resources.

Ok? And then what I will do, I will add an update to its project manager every week. Ok? Ok. Ok.

Ok. Ok. Ok.

Ok. Ok. Ok.

Ok. Ok. Ok.

Ok. Ok. Ok.

Ok. Ok. Ok.

Ok. Ok. Ok.

Ok. If the delivery is late, there will be a blocker behind it. When I give the update, the first step will be the data.

The second step will be the delivery of the products in the form of boxes. When I select the green box, I will have the option to add details to the delivery. If the delivery is green, I will leave it empty.

If there is a warning, I will add a shortcode to the box. I will be able to say that this line item caused the blocker. I will be able to show the problem to the person who is in the problem.

What message has been sent? DMC There is a demo of it on AmpliCache, is that why it is not available? No, if it is available, people just stop it. We are just asking internally. We are sitting together in discussions.

Okay. Yes, did you understand so far? Or not? Any questions? Did you understand? No, questions, questions. Okay, I have a question to put in.

This idea is like a smart sheet or a project management tool? No, this is an i360 view, i.e. a T360 view. This is not a smart sheet concept where I am putting all the details. This is somewhat of a custom solution.

We will be very picky about the design. Because if I have to give an overview of the year to someone quickly, how will I do that? Workflows will be made to ensure data. Workflow will be important in this.

To ensure data, i.e. if someone is not giving an update, what will happen? When users are added to this, we will make a user matrix or evaluation matrix. We will keep a number of points for those who are not giving an update. We will keep a number of points for those who are giving an update.

When they are giving an update on the basis of AI, we will keep analysing the previous updates. We will come to know how many updates they are giving and how many they are not giving. And what is lagging a lot.

Okay? It is also important that we bring this due date factor into our line items. That we have given this due date. We are not giving this due date to make the task red or green.

This is somewhat for reference. This person gave this due date on this day. Now give the due date of the same thing ahead.

Then in the analysis of AI, we will know that these things are happening up and down. And that is somewhat of a highlighted point that this thing will be highlighted. Okay? Now, according to the person who is giving good updates, the matrix will also become good.

Then there will be a project matrix. Then every person's evaluation will be visible in the matrix. Now, there is nothing to worry about.

If a person is not on a project or he is sitting free, then what is the game of that? The important thing is that he should be doing something. So, we will make an internal learning project of TechWorks. Or the internal project that we are making, we will put this.

So, there will be updates of that. And in that, we will not even say that it took 8 hours, 2 hours, 3 hours. This is not a module yet.

Okay? If need be, I will see this. But this is because tomorrow we are bringing this work from home policy. Or any such policy.

Which will benefit you guys. But I don't want that the project that is behind will be cut. Okay? So,

all these things will be ensured.

If no team is doing. If even one person from a team is doing this, then the team will be told to come to the office. Okay? That's how it is.

So, then there will be penalties in it. Or on the basis of ratings, the whole matrix will be there. So, I told you guys this because I don't have a key matrix yet.

That I can define it for everyone. But when you have to define the user, then you have to keep this aspect in the user that this matrix will be calculated for him. Okay? Okay.

Now this update module is done. In this, I told you that I will have a T360 view. In which I will open a project.

So, I have 52 weeks. So, 52 small boxes will be coming. In which I will know that green, green, green, green, this is yellow, this is red, this is blue.

So, we will know which project is in which state. There will be a box like this every week. Like this.

I think we should do it like this. Project wise and employer wise, these are two different things. Employer wise, we are still discussing project wise.

Okay. What scene is this? What is this? Look at this. Look at this.

Now here, this is on this. Okay. Now this is a view type.

Now if I open the project, I have this view on top. So, I will know immediately that what scene is where, what scene is where. Now in this, this is yellow, green.

We will do green, red and yellow. Okay. After this, what else was there? In this, the main making was there and later Delhi was there.

Delhi is to be done. Delhi will have a different workflow. Daily workflow will be different.

Then I told you that the person who is not doing it, there will be a workflow for him. The one who is not doing it, after one day, two days, three days, after three days, an email has been sent to his manager. You have to come to him.

You have to come to him. You have to define the user. You will have to define the time as well.

Okay. So, all this is there. This is somewhat of updates.

Now with this, suppose I put a GitHub repository. So, my data starts coming from GitHub. And I can tag certain commits with my project updates.

And I will get its analysis from GitHub. I mean, I will get it from AI or from GitHub. Some of its metrics will be there.

What was the line of code in this? What was it? Accumulative. That is, if I have a weekly, then we know how much each person has accumulated. And how much is the accumulative code chain.

Okay. So, all this is there. Aspects are not there.

Now, there is a question here. In this, we are saying that a new project has come. Then it will have a complete timeline.

So, will it be of a fixed cost or will it be of another project? It will be of another project. So, a new goal will be defined every week. You don't have to define the goal.

There is no goal. You don't have to update the goal. We have to do the analysis on the accumulative weekend.

On Friday, we have to see what will happen. Or in the next week. There is a green head signal.

The manager will decide manually. The manager will decide. Okay.

Or the project lead will decide. Okay. Okay.

That means, there can be two levels in this. You decide. And go to Manohar in the workflow.

Then Manohar says, I think you are saying green. It was amber. Then Manohar put it in amber.

Then he came to me. Then we sit and see your analysis and Manohar's analysis. And based on that, we will go to an external level.

Because it is final from here. It can't be from the top. But it can be override.

At any level. But that override in case. If I say it is like this.

He says like this. I don't know the financial aspect. I don't know the billing.

But we will give it to sales and so on. So that we know what they are seeing. We are doing it.

There we will know that there will be no billing. Right. Okay.

So we have to do all these things. One more thing I was saying in this. That add-on was that.

Yes. You have told the quality aspect. The quality will be ensured like this.

For every step. For every step. First will be the summary of the project.

Not the workflow. It will be the wizard. When I start giving weekly updates.

I will select the week. It will come to the summary. I will write the summary there.

That will come from AI. That will come from JIT. Okay.

After writing the summary. Then. Yes.

After writing the summary. What will happen? That. The next step will come.

In the next step. I. Summary of. These metrics.

That is, I will say that. Delivery is Amber. Financial is Amber.

Current quality is Amber. And one more. Which I have made.

It is released. But I will evaluate it. Maybe I will do it differently.

Is it Amber or Green? By defining this. After that. Four more wizards will come.

In which I then. Individual details of all these steps. Now what I have to define in it.

I have given it separately. For financial. It is possible.

The developer. Means. Employees have not seen.

This is also. This is also. That sales people.

Or. Billing from finance people. Part.

I see. And through that workflow. Go to him.

So the role will also be role-based. It will be role-based. And the workflow is also role-based.

Okay. So that. I will update it.

I mean. I will upload the document in it. So I say.

Man. His invoice is fine. I will upload it.

Me. Just to confirm. They sit from above and say that.

This is green. Green. What are its proofs.

Okay. Like this. Now like delivery.

Delivery. Again. We will sit with Project Manager.

That we will see. That delivery. Green in the wind only.

There is no matrix. Velocity graph. Point down graph.

There is nothing. We have done so many tasks and this is the feedback of our client. We will attach everything there so that we have proof.

We have some work to do. So, this one is correct. So, these four widgets will come in which we will put a text box and a multiple file upload button.

Okay? So, I will write that and I will save. Information means save. And with that I will upload multiple files.

I will upload my files. And there will be a small description of their files. Whose file is this? Whose file is this? Did you understand? I mean, I cannot clear more views than this.

Is this done? Now, we have to make one more module with this. That module is of allocation. Okay? The allocation module will be weekly.

But in that, all the resources, it is not project wise. In that, all the resources will be coming on one side. Day will be coming on top of that.

Of that week. And what is their allocation? Okay? This will be hourly basis. What? This will be hourly basis.

Yes. In this, what we have to do now is that in front of every person, two things will come in per day. Which project? Or which project? And how many hours are there against them? Okay.

Okay? And this is hourly basis. In this, the input field will be one. Select the project.

How many hours is the input field of that? Select the project. How many hours? Select the project. How many hours? Okay? I mean, the list of people coming on one side.

The list will be like this. Assume the table of every person. Now, I am not able to understand visually.

But we have to make a good table. I found this clean and beautiful. Is this project beautiful or not? Right.

Okay? All your people come on this side. About 50-60 people. They come up on this side.

When I have to allocate, I select the week. We have to keep our matrix on the week. Then the cumulative data will come on it.

Okay. We have to drill down the week in days. And you have to take the year and so on.

Okay? So, I will select the week. I have all the people here. All the developers and whatsoever.

The dates will come up. 5 dates will come in the week. If it is a working day.

Okay? Now, there will be a column against each person. Here, against each person. Now, we have to think how to allocate.

So that I can select there. Multiple projects. And against each project, the people's dates.

We can keep a pop-up. Sir, if I have to update 150 people in the pop-up. Don't you have to do it? No, I am saying this.

So, you have to think yourself. What? If you have 600-620 people below. So, you have to open 20 people.

And against each pop-up. It will be difficult. It can be anyone.

That I just select 2 projects. Immediately put the dates. Select 2 projects.

Select 2 projects. Put the dates. And the second is that I will put this once.

So, when I will do the last next. So, that copy from. I have the option.

So, copy from previous week. So that I can do all the maps in the same way. In which I have to change.

I will change it. This is a small problem. Okay? Sir.

And what is the impact on its save? That I have everyone's allocation. Calculated according to the weekly and per day. It is also calculated weekly.

Calculated monthly. And this game. And in this too.

This chart. But how is this chart? I don't know. How will you show? So many tools have come.

Show a good video. 160 hours should be our total. So, we will put a threshold.

This is the threshold of green. This is the threshold of red. Okay? Okay? And this.

And this is a project which I have given. The purpose of calling this is that. He will oversee.

And he will help you. Where you are stuck. But in general, only AI is there.

In this. I give the plot. Or I log in.

I want it to be fully developed. With AI. And I don't want.

If I am stuck here, then I am stuck there. I will see the environment of AWS. Deploy on AWS.

This should be scalable. What happened? Nothing. No.

Sorry. Deploy on AWS. What else should I say? Deploy on AWS.

Domain. I will tell you later. We have to make a backend.

Multiple backend. Workflow. Hatchet.

Okay? Hatchet is a tool. Workflow. I will tell you.

Workflow can be defined. But it will go in hatchet. And it will go in node.

Tracking. Okay? Anything else? So, for the time being, there is no integration in the 3rd party yet, except for HPE. Let's say... No, but keep it open.

Keep it open. Open means that your workflow should be a little dynamic. All of these things should be managed through workflow.

Let's say, I create a Slack node in the workflow, I'll tell them that this project is okay, when this guy did not update for so many days in this project, then the managers of this should send notifications to Slack, or should send notifications to the teams. So, this is the node with notifications for the teams. So, workflow is important.

I can see the workflow visually. It's not that the workflow is the workflow. And the workflow should be so easy that everyone can make it.

Right now, I have told you not to make it infinite. Make it finite. Do you know what finite means? It will be sequential, but it can have multiple nodes.

I mean, one step is done. If you go to the next step, there will be two nodes. There will be two nodes, but they won't be able to go beyond those nodes.

Okay? One node is done, but not beyond that. Yes. So, there are no infinite nodes.

No. I can say that in this project, within three days, if no one gives an update, the manager, the VP, and the director will receive an email. So, you can put it in such a way that this will go first, then this will go, then this will go.

But the problem is that if this doesn't go, then this won't go, then this won't go. Now, what I am thinking here is that I have come here and stopped. Three routes have come out of this.

This has to go, this has to go, this has to go. This is in the panel. But with these three, it won't be that if this goes, then what will happen next? If this goes, then what will happen? There will only be one next.

Even if I have to extend this. Okay. That the email should go, this should go, then the email will also notify on Slack.

Okay. Okay? Okay. What is the deadline? Two weeks.

In this, you had mentioned that someone has given a deadline for a work. So, he will put it manually. What will be the details of that work? Or is it just within one project? This is not a daily update.

It is possible that you add on that there are line items in this. What are daily updates? There are line items. I have told you the different types of line items.

When I am defining a line item, then in that, I have description, title, name, due date. Today's field can be there, but we are not adding it now. So, in that, the field can be extensive.

Okay? That line item is your cumulative update. Hmm. Here, I will give this user the option to write whatever he wants openly.

And you know the people here, if someone writes whatever he wants, then what will happen? Hmm. Here, I will give them a structured form. First, I will get the data made.

Then, I will add it on. And based on that, I will format their update myself. So, this is a better way.

Now, people have a problem. See, adding a line item is easy. Now, you people have to think that you have to see it yourself.

If I tell Uzair to add a line item, then Uzair will say, it will take me half an hour. If there is a table format like this, if I press enter, it will come down. If there is a table format like this, if I press row, if I write quickly in it, my structured update will be made quickly.

This is the purpose. You people have to think for yourself. That is why I am giving you people that you have to think for yourself that how can I update quickly, immediately.

Okay? And everything else should be configurable. Configurable, in a sense, that what threshold I have to keep. Hmm.

Hmm? No, no, tell me. Yes. I mean, not evaluation.

I mean, I said, look, when do you have to go for escalation? For one person. We are defining that in workflow. But things should be configurable.

For example, when I have to do project holidays, holidays, project settings, I define holidays. I have updated the holiday day. Okay? Project settings, I mean, what else can be there? Hmm.

For example, if we take two people in front of us, now their task is a multi-tenancy one. Respect

on it, they are working, half are working, I am leading. Now we will give updates on all three of them.

And when we give updates on all three, now multi-tenancy, for example, they have to deploy the duty. So... Now, this is also a good question for you. And now, I have got an idea in my mind, that a project manager and a lead, sit and define tasks for each week.

Hmm. Okay? And the people who have to add line items, those line items should be added on the same task. Okay, I am telling you, if you are adding line items, then which tasks... parent, yes, my parent task is multi-tenancy, and I did this work in it.

I say, I gave two hours to multi-tenancy, two hours... not yet. Not yet. Okay.

My purpose is that people should be responsive in their... what they are doing. It should not be difficult for anyone to say, what am I doing? If someone... I mean, you are doing it. I came to you as soon as I came.

You are going around. Now, maybe you are also working under me. I don't know.

Now, until I ask you, no, you will not tell me, how will I know? Yes. Right. Right.

Now, ask some more questions. If, for example, in multi-tenancy, all three of us have logged tickets, then at the end of it, a summary will be made, weekly, that all three of us have five tickets, five tickets, we have logged items, and five, three, fifteen, fifteen items have come, and then a manager will give a summary. Means, this task was there, in it, this multiple task, this person did this, this person did this, this person did this.

Yes, that will be updated weekly. that will be updated weekly. My question is, still, the system we are designing, this is, ongoing projects, then how will we integrate them in this? Their data, or, from the time they are on-boarded, they start.

Means, today, if everyone is on-boarded, then, from tomorrow, we will start. We will not do this in the past, that we will not give. Yes.
