I will take out the screen. One minute, I will open it. I also made a plan.

Ok, you can use this. After this, we will see the daily updates. How are they coming? We will open all of them.

Go to Overview. Go to Overview. Go up.

Customer Portal. Ok. You will get your weekly status.

You will get the weekly status where you will put a combatant and get it generated again. Whatever time you want to get it done in a week. And then there are other reports.

No, I am not selecting a week here. We have to put selection in both things. Put that, that is important.

And after that, your entire team will come. Who is doing update compliance? This performance score update will go on it. Right.

On completion, we will put its compliance. After that, employees come. Sorry, come on resources.

This came on resources. This is coming from total resources. This is coming.

We will put another compliance one here. Because it is saying that it is not complying. Now if we open this, it means that it has come.

It is doing quality consistency. And on top of that, how much update has been missed? How many projects are running? And update. My dashboard is fine.

Yes. What we have to give, i.e. crud. That is important.

What we have to add. Yes. The one with update.

Doesn't it have update? With which we take update, create update. No, it is not in this. It is not in this.

Here, I think this should not come so much. No. You know, all these will fly now.

When you get that, you will get roles-based permissions. I had it here first. When I went to Luton.

That's why I started with updates. Updates are important. What is being updated? How is it going? What metrics are you giving? That is important.

In that, there are 2-3 things. Yes. The release one.

I studied that. Schedule comes in that. Then it has delivery.

Then it has financials. And then it has budget. Yes.

What did I tell you guys? You said delivery. You said delivery. You said quality.

Add quality. Let's do 5. Quality. Write it down.

Schedule. Schedule is number 1. Then we have Delivery. Then we have quality.

Then we have financials. Then we have budget. There is no release in that.

No release. Okay. Okay.

After that, if you want to log on to a project, you can add tasks and updates from here. This is a big secret. The problem is that you guys have to listen to your own calculations.

I am explaining to you guys that I will make this, you make that. You guys have to ensure that you make your own teams. You see how long it takes me to add an update.

And what I told you, I made line item first. No, we have thought like this. If a task is made first, now in the daily update, that person will select his update from the drop-down.

And add his update in it. Or do it like this. If you want to do it fast.

Not mine. Who will make the task? Project. This is wrong.

This is the thing. I want, I say in the workflow, I mean, I want to make a task. Arrays.

For example, not in this project. Arrays. We will make arrays.

So important is, that you guys understand this. Why I started this activity with you, this will start with other teams too. I came as a client.

I gave you the requirement. You are standing at 20% of it. You have brought the design to me quickly.

Okay. So this thing is not fine. This thing is not right.

This activity is to teach this. Okay. How will you get a requirement? How to make a design quickly? No doubt.

You, Is Usman sitting in front? Usman. Designer. Designer.

But. Come on, don't do anything else. Asnaad, come back.

Asnaad. I will use it like this. The whole company will be involved.

Okay. Okay. This was Logan's question.

I was going to go ahead. I just wanted to ask. Sir, I have signed it.

Please sign it. This is its dashboard. Total projects.

How many are there? How many projects are there? How many green projects are there? I don't want this. Reporting is. Send it on the project.

Okay. I am coming here. Look at this.

If you look at these projects. All the projects are here. What progress is required? What is the status? Who is the PM? Do you want it like this? No.

Okay. After that, you can see the details of this project. What is your pain point? I have 2-3 pain points.

One. What I am telling you. How did you put the data first? That is the pain point.

Showing is later. How does the manager put it? No. Okay.

Yes. Then how will the dev put it? How will the dev put it? How will this happen? For me, it is important that the data is put quickly. When it will be put quickly, then it is easy for me, it is easy for you people, it is easy for Manohar.

Then how to show that data? That one view is necessary. Which is i360, i.e. T360 view. Okay.

Look, Jira is mostly used here. Because it is done in a sprint. Now, if you want to get data from Jira.

No. There is nothing in Jira. There is nothing in this organisation.

Okay. I have to make this tool in such a way that if I add a tenant in this, he will start using his own system. Okay.

I have put the resource, I have put the project. This is basic. Now, after the project, I have told him that from this date, this is the workflow.

Generally, this workflow will be made. Make the workflow. Now, in the workflow, what is the escalation, matrix, etc.

This is done. After that, the important point was what line item to put. How to put the line item? Put the project on the line item.

Project setting has to be done. Is this okay? Project view, which is okay. I do not have a problem with project view.

No problem. The problem is that you did not focus on how to validate the credit. New project.

No, this is not on click. This is not on click. This is on the button.

What do I mean by button? Right. Are you understanding? I have updated this. Now, if you think yourself, if you have to work daily and you have done 10 tasks in a day, how will you put it? Let's put a summary here.

Summary also. That was my point at that time. No, I did not put it.

I did not send people to give ideas. If you do not put a summary, you will go. You are the line manager.

If you put a summary, I did work on tenancy. If I sit and watch at night, I will keep thinking what is tenancy, what is tenancy. Here we will make a point system that you keep adding points.

We have already decided. You said that I have made a task multi-tenancy. In multi-tenancy, there will be 10 types of things.

I have made a table of user, and a table of tenant. I made its API. I did this.

I did that. I did this. I did that.

Okay. This happens. I went to the user and put the tenant's ID.

Then I put the tenant's ID on this table. Then I put the tenant's ID These are all its tasks. When it will end, we will understand.

But AI will know that one task is multi-tenancy. In multi-tenancy, the description below is so relevant that AI will evaluate it. Rather than I keep sitting and evaluating.

Are you understanding? Arrays should know what Adia did in tenancy and tell it whether it is relevant or not. Secondly, I have been updating for three days. Arrays should know that Adia has been for three to four days.

Is it stuck? Is it a problem? Thirdly, when I am sitting in the project, it is a blocker. Blocker should be a line item. Okay? Okay? And Rohan on that day means today puts that blocker in his update.

Blocker's internal will be the same. Blocker comes up and below Rohan can have a description below. That because of this I am a blocker.

This is that. Rohan saves it. Hits it.

That data is saved. Now what will happen when I ask him that in this day in this month in this week why is this delivery in this week amber? Or if I click on that amber, I will immediately see that Rohan gave an update and this blocker came here because of this. There was a delay here.

Then when Mahnoor will see then Mahnoor will update that yes because of this this thing was delayed and it was approved and then it was delayed. Okay? So think like this. If you the workflow like this then you this.

Exactly. This was the workflow. This is right.

This is right. This basic listing is right. The problem is that when you are going you are so much that You will see it after a week.

I will see it daily. This is my decision. This decision will not be hard coded.

Exactly. I will say that since it is a multiple project we will give flexibility to Aries that we will see it after 3 days. If we will not see it after 3 days, then we will get an email from pending people.

This is a workflow. Sir, what will happen if pending approvals are coming that this is our workflow process. Yes.

These are pending approvals. Yes. These are automatic approvals.

Yes. Whether to auto-escalate or not. In this workflow, you have based the rules.

Go up. What is this? Developer, project manager, delivery manager, engineering manager, director. This will be the purpose.

This will be the purpose. These are pending approvals. No, sir.

I am talking about workflow. How will you define workflow? In workflow, what I just said, that I made a workflow that all the Aries on this project, now it is like this, project can be workflow, global workflow can also be. Aries on this project, every day you will see that his people have given updates.

If he is not watching, then I will send him an email after 3 days that Aries, you have pending work every day. So, this should be a workflow. Okay.

I will send his pending updates to everyone at 6 o'clock. So, this is a workflow. Okay.

Reminder. Yes. The work we do, we put a worker on the backend and he does the work, I want to define it myself.

What are the entities in it? What are the actors in it? How do I trigger things in it? Trigger and action, these two things will be there. What will trigger and what will be the action? You have to

show things role-wise. You have to show things role-wise.

You can do it like this, for example, you have defined organisation, you can choose any name of your workflow. There is a definition. You can attach it with the project.

Multiple workflows will be defined on it. You can attach your workflow with the project. Other than this, tasks, system workflows and custom workflows.

System workflows are automatically attached with every project. We have not made anything like this. How? There is a task, there is a process.

These are the daily day-end updates. Basically, we have to see how many people are working and we have the end result. We have to do everything daily.

It is a matter of who is watching how many times, that condition will come later. But you have to keep it according to 52 weeks. When I click, it will expand.

Okay. That's it. And above this, if there are years, if I add years from the previous year, it will be a year.

It will be a filter. But this is afterwards when you start getting data. Another thing is the decision between green, red and yellow.

Who will decide this? PM? Or this is in the workflow. But the point is that the first important module is updates. Apply on that.

I told you that when I go there, I get a platter view. Weeks are coming. In that week, there are grey weeks whose updates I have not given.

There are green weeks whose updates I have given. I go and click that week, it opens in a view. In the view, there is an executive summary.

Executive summary will have a title. Updates for 25th week or Agile Pattern or anything else. Yes, it can be.

Or I will say, you have to do it. Weekly updates. In that project, I will define weekly updates.

We will get to know. Approver will be the chain in that project. I wrote AI.

AI will pick all people from logs and make an update. All developers, what they have done. If we have added line item type escalation, then that escalation will come.

Always keep escalation separate. Do not make line item. Escalation on project.

But that line item will not be there. It will not be visible where individual person is giving update. There are two questions.

One is that Do we have to add QAs in this? QAs, designers What is the connection? For example, we make QAs Tickets will not work. Pipeline will be made. What will lock PMSV? It is not needed.

QAs will lock it. Daily update will be same as developers. Why do we choose role? I have made a project.

I have added 10 people. They have to give update. If task is not made, they have to ask their respective person to make task.

HR will be with sales. HR will be with roles. We will talk about it later.

We do not want to see from PMO engine point of view. We want to see from our requirement point of view. We want basic updates.

Either it is coming from resources, either it is coming from project manager, either it is coming overall. When we open portal, it will be visible what was last week's resource wise update, management wise update, scenarios, is it green, is it blue. When I gave project update, it will be visible.

I told you to save it. Next wizard step will come. I have told you about create update.

You are not writing it. That is why you are confusing. I have told you everything.

Did I tell you or not? First is executive summary page. In that, AI generated executive summary plus whatsoever I can write. And some attachments in that.

Attachments will be there in every step except second one. I can attach multiple attachments and their description. Next step, I told you 4 boxes will be visible.

Not 4, 5 boxes will be visible. I will click on first box. It will ask, is schedule on track? It will not ask like this.

It will ask, what is the status of schedule? Is it green, amber or red? I will say, it is green. Then I will click on second, third, fourth. When I click on fifth, it will open next step.

In next step, there are 5 redundant steps. In that, I told you, it is skippable. If I put something in it, it will be visible.

First step will be of schedule. Details of schedule. If someone wants to add extra information in details of schedule, he can add there.

He can add line item there. He can add description of his will there. He can add attachment there.

Ok. Next is delivery. Next is quality.

Next is financial. In financial, I can tell Sheroz, that you made invoice with it. I should have option that it has reached this stage.

I got this update from Manohar. I went to workflow and assigned a person customly. I told him that Sheroz Mubarak is a person in our company.

He should go to him. If he goes to him, he will know that I have updated this thing. If he updates it, he will get a log that he has updated this thing.

If he updates it, he will send it back to me. Ok. He will approve it.

I will show this to Khalid bhai. If I approve it, it will go to Khalid bhai. Khalid bhai will go to see it.

Khalid bhai will not understand. Khalid bhai will say either I have to send it back. Either I have to send it back.

Send it back means he will send it to me. I think his budgeting is in ember. What will I do? If I have override function, I will do it in ember.

Otherwise, whoever has override function, I will send it back. I will send it to Manohar. We have to send it back to Sheroz.

I will send it back. I will send it to Manohar. I will send it back.

This is how you will get updates. This is the main module. The second module was allocation.

In allocation, there is a simple pager. You can open it. Your employees are coming here.

They will come to you for a week. 5 days. You have to put project-wise allocation for each employee.

When I put it for a week, you have to give me an option that you didn't even copy last week. So that it is easy for me to copy it. You have to do calculations on the basis of that data.

In a month, he has to do this and that. In a week, he has completed 160 hours. In a week, he has completed 40 hours.

If someone goes on leave, we will bring him later. But at least the project holidays have to be included. How do I edit the content? Workflow, state, etc.

In the second game, you have to make hierarchy. You have to see how to make it. Till now, the role is simple employees and admin.

I think you should make a workflow according to general rules. I can override it There will be a

node type in my workflow. When I give a project status, I will put its name.

That node type will be add. This is my call. Thank you.
